

# Overrunning and Backstopping Clutches

FOR MINING APPLICATIONS

**FORMSPRAG CLUTCH™**

**PRODUCT  
CATALOG**

# FORMSPRAG OVERRUNNING AND BACKSTOPPING CLUTCHES ARE HARD AT WORK IN MINES AROUND THE WORLD

For over 50 years, Formsprag Clutch has been a recognized leader in designing, manufacturing, and delivering dependable long-lived overrunning clutches for a wide spectrum of applications in the mining industry.

By offering the broadest range of both sprag and ramp & roller type overrunning clutches and backstops available globally, Formsprag Clutch, together with our sister company, Stieber in Germany, is the world's leading authority for solving mining application challenges requiring overrunning clutches.

## BACKSTOPPING APPLICATIONS

### LLH® (Long Life Holdbacks®)

LLH holdback clutches are mounted on the head shaft of the conveyor, typically on the side opposite the electric motor and gear reducer. The LLH clutch allows the headshaft to freely rotate in the driving direction while preventing any rotation in the opposite direction.

### HSB (High Speed Backstops)

HSB units are intended for use as backstops on the high speed shaft or intermediate shaft of a reducer, and as holdbacks on the head shaft of conveyors. They use standard clutches with the addition of the oil reservoir. The oil reservoir is an aluminum casting with cooling fins. HSB models have a spacer replacing the seal at the reservoir end to permit free oil flow between clutch and reservoir. The reservoir has a flush oil sight gauge and a combination breather and oil filter.

### FHB Backstopping Clutches

FHB is a high speed, centrifugal throw-out (C/T) Sprag type backstop with internal sealed ball bearings. It engages instantaneously and automatically to prevent any reverse shaft rotation. Operates at higher overrunning speeds and holds greater torque loads than competing backstops. A larger number of torque transmitting C/T Sprags reduce the hertzian contact stresses during backstopping leading to longer life than is possible with shoe designs.

## CREEP/DUAL DRIVE APPLICATIONS

### FSO Overrunning Clutches

In northern climates where there are outdoor conveyor belts that do not run continuously, they can experience the conveyor belt idlers freezing up. A solution is to operate the belt at a low and creep speed to prevent this. The FSO overrunning clutch is the safest and easiest type of clutch for this application.

Formsprag's Quality Management System is certified to ISO9001:2008 and AS9100 Rev.B.

## Clutch Functions

### Overrunning clutch

This class of applications is typified by standby and compound drives. For example, a steam turbine and a standby electric motor may be connected to a single driven shaft through overrunning clutches. The shaft can then be driven by either the turbine or the motor or both with no further modification of the installation. The turbine drive clutch automatically engages when the turbine starts to drive, but automatically overruns when the load is transferred to the electric motor.

### Considerations

- Type of motor
- Max starting torque
- Internal combustion engines, please consult Formsprag
- Nominal driving torque
- Range of driving speed
- Inertia ( $WR^2$ ) of the driven masses
- Range of overrunning speed
- Number of starts during service life
- Shaft diameter

### Applications

- Dual motor/engine drives
- Conveyor belts
- Creep and starter drives
- Disengagement of centrifugal masses

### Backstopping clutch

In backstopping or holdback\* applications, one race is always fixed to a stationary ground member. The function of the clutch is to permit rotation of the mechanism, connected to the other race, in one direction only, and to prevent any rotation in the reverse direction at all times. Although the clutch normally overruns most of the time, it is referred to as a holdback or backstop in conveyors, gear reducers and similar equipment because its function is to prevent reverse rotation.

*\*“Holdback” is a name given to a backstop clutch when mounted on an inclined conveyor head shaft.*

### Considerations

- Motor breakdown torque
- Maximum dynamic reverse torque due to elasticity of the locked parts: elastic belts, shafts of more than 9 feet (3 meters) long
- Range of overrunning speed
- Number of torque applications during service life
- Shaft diameter

### Applications

- Inclined conveyors
- Bucket elevators
- Pumps
- Gear drives
- Fans

# Overrunning Clutch Designs

## Ramp & Roller Overrunning Clutches

### Two Design Styles

Stieber overrunning clutches are available in two basic designs:

- Ramp & Roller
- Sprag

Overrunning clutch speed is a major determining factor in selecting the design best suited for each application. Ramp & roller clutches are used for applications with low-to-medium overrunning speeds and for indexing. Sprag clutches are the choice for applications with high overrunning speeds and for backstopping.

With each basic design there are several variations to choose from to meet specific application requirements. These variations include clutches with or without internal bearings, as well as a range of mounting flanges, covers and couplings.

### Ramp & Roller Design

These rugged, reliable clutches consist of a cylindrical outer race and an inner race incorporating the ramps on which the rollers ride. The rollers are individually spring loaded to provide constant force between the rollers and both races. This force ensures instantaneous lock-ups when switching from the overrunning mode to the driving mode.

This design is also quite versatile, as the clutch can be operated in all three modes: overrunning, indexing and backstopping. The outer race has greater overrunning speed capability than the inner race, making the unit ideal for use as an indexing clutch, with the outer race acting as the reciprocating member.

For increased accuracy in indexing applications, specify "V" type, with stronger energizing springs.

When the outer race is the driving member, this is the resultant race activity.

### Sprag Design

A sprag overrunning clutch consists of a cylindrical inner race and a cylindrical outer race surrounding it, with an annular space between the two races. A full complement of accurately formed sprags fills this annular space. Each sprag is essentially a strut placed between the races in such a way that it transmits power from one race to the other by a wedging action when either race is rotated in the driving direction. Rotation in the other direction disengages the sprags

and the clutch is free, or overruns. Either race may be the driven member or driving member.

If one race of the overrunning clutch is securely fixed to a grounded member, so that it cannot rotate, and the other race is free to turn, the free race will turn freely in one direction of rotation, but will be locked to the ground in the opposite direction.

In an overrunning clutch, the specific

sprag shapes have been developed to meet most conceivable types of clutch applications. Since different types of overrunning applications involve different loading characteristics, different sprag shapes are used to provide the greatest possible life, torque capacity, and functional characteristics for the three basic types of overrunning clutch applications: overrunning, indexing, and backstopping.

### Various Sprag Designs

## Ramp & Roller Design

Ramp & roller clutches consist essentially of an outer race with a cylindrical inside diameter, an inner race with ramps, and a set of rollers which are individually spring loaded to provide constant contact between the rollers and both races. This arrangement assures instant action at all running speeds and guarantees immediate driving capability whenever one of the two races rotates with respect to the other in the drive direction.

## Application

Clutches of this type can be used in all types of overrunning, backstopping and indexing applications.

**When used as an overrunning clutch** the ramp & roller clutch should be mounted in such a way that the outer race is the overrunning member. This is especially important with higher overrunning speeds. In applications where the inner race overruns, the centrifugal force on the rollers results in lower overrunning speed limits.

**When used as a backstop** a ramp & roller clutch with rotating inner race is especially suited at lower speeds. If the RPM is higher than the RPM recommended in the tables, we suggest using a sprag type clutch.

**When used as an indexing clutch** the outer race should always be the oscillating member and the inner race should be the driven member. Otherwise, the inertia of the rollers and springs will lead to inaccuracies, especially at high index

frequencies. The use of thinner lubricating oil and stronger springs will provide higher indexing accuracy and can be supplied upon request.

## Sprag Design

This sprag-type design overrunning clutch generally consists of an inner race, an outer race, a set of sprags, a sprag retainer, energizing springs, and bearings.

The wedging of the sprags between the races transmits power from one race to the other. The sprags have a greater diagonal dimension across one set of corners than across the other (see Figure 1). The wedging action occurs when the relative rotation of the inner and outer races tends to force the sprag to a more upright position where the cross-section is greater.

**Figure 1**

Detail of sprag. Dimension "A" is greater than dimension "B."

## Gripping Angle

Wedging action depends upon the wedging, or gripping angle of the sprags between the races. The fundamental concept of sprag clutches requires that the coefficient of friction of the sprag, with respect to the inner race at the instant torque is applied in the drive direction, must be greater than the tangent of the gripping angle, GA. If the condition is not satisfied, wedging will not occur.

The gripping angle is determined by the construction of Figure 2, where points A and B are the points of contact of the sprag with the inner and outer races, respectively.

**Figure 2**

Geometry of sprag, showing gripping angle "GA."

Sprags are designed to have a low initial gripping angle to insure positive initial engagement. As torque increases, the sprags produce radial forces which cause race deflections, which make the sprags roll to new positions. Sprags are usually designed to have an increasing gripping angle as they roll from overrunning position to maximum load-carrying position.

A higher gripping angle reduces the radial load imposed by the sprag, thus permitting higher torques to be transmitted within the limits of race stretch and brinelling.

**Figure 3**

Gripping angle increases as load increases and annular space increases.

Formsprag and Stieber manufacture a wide variety of sprag sizes and shapes to meet the market requirements.

## Free action

In the Formsprag “free action” retainer all sprags are permitted to have free and independent action. During overrunning this allows each sprag independently to adapt itself to any variations in annular space caused by runout or by foreign matter which may inadvertently get inside the clutch. Since each sprag operates independently, it cannot transfer the effects of variations from one sprag to the next. With all sprags in uniform engagement at all times, the load is evenly distributed. The free action principle also distributes wear evenly for a minimum of wear on all components.

## PCE® sprag

PCE sprags are designed to overcome the effects of severe torsional and linear vibrations as well as high transient torque overloads. It is a Formsprag exclusive. This design, which provides built in protection from otherwise damaging overloads, is now standard in model sizes 300 through 700.

## Sprag Energizing

The sprags are energized by springs that act upon each end of each sprag. Formsprag has developed several different types of energizing springs, such as contracting springs, expanding springs and a torsional type spring. In each overrunning clutch the type of energizing spring used will reflect Formsprag’s broad experience in the design and application of overrunning clutches in the choice of a method of energizing best suited for the particular design of clutch.

In all cases, whether the spring is an expanding spring, a contracting spring, or a torsional spring, the spring design energizes each sprag individually without transfer of motion or effect from one sprag to the next.

## The C/T Sprag Principle

Centrifugal Throwout, or C/T, retainer assemblies are designed for high speed inner or outer race overrunning, and lower speed drive conditions. C/T sprags are available in a variety of models. Model FSO sizes 300 through 700 are available with PCE or C/T sprag option with outer race overrunning.

## Outer Race C/T

In the outer race centrifugally disengaging sprag design, the mass of the sprag is located so that when the outer race is overrunning, the centrifugal force of the sprags overcomes the force of the energizing spring causing the sprags to completely “lift off” of the inner race.

## Inner Race C/T

Model RSBI & RIZ sizes 20 through 240 are available with the inner race C/T feature.

In the inner race centrifugally disengaging sprag design, the mass of the sprag is located so that when the inner race is overrunning the centrifugal force of the sprags overcomes the force of the energizing spring causing the sprags to completely “pull away” from the outer race.

The point at which the sprags lift off of the inner or outer race is listed as the “lift-off speed.” The maximum drive speed is always less than the lift-off speed to insure positive sprag energizing.

The primary advantage of the centrifugal throwout sprag retainer is that when the sprags lift off the inner or outer race there is no rubbing contact in the clutch. Therefore, the life of the clutch is determined by the life of the bearings.

**Note:** In centrifugal throwout designs, the sprags lift off the inner or outer race during overrunning. Therefore, for drive conditions, C/T designs require that the driving speed be lower than the lift-off speed.

## Formchrome® extends sprag life

Ultra-hard Formchrome sprags provide extra-long life, maximum wear resistance and lower maintenance costs. Formchrome sprags — exclusive with Formsprag — are made by diffusing chromium into the surface of hardened high carbon alloy steel to form a chromium-carbide alloy.

## Selection Procedure

When a clutch is to be selected on the basis of torque calculation, follow the eleven steps below:

1. Calculate **load torque** to be transmitted by the clutch.  
$$\text{Torque (lb.ft.)} = \frac{5250 \times \text{HP}}{\text{RPM}}$$

or

$$\text{Torque (Nm)} = \text{lb.ft.} \times 1.356$$
2. Select the proper service factor from the appropriate table on page 9.
3. Determine the **design torque** by multiplying the load torque by the service factor.
4. Check the key and shaft stress before making a final clutch selection since this may determine the maximum allowable drive torque capacity.
5. Determine the overrunning and drive speed along with which race will overrun.
6. Select a clutch **MODEL** and **SIZE** from the catalog based on design torque, bore size, overrunning speed and dimensions for proper fit into the available space.
7. If the **outer race** is the overrunning member, then determine if the C/T option can be used for the clutch model selected.
  - a. A Centrifugal Throwout (C/T) model clutch may be used if the drive speed is less than the maximum C/T drive speed and the overrunning speed is higher than the lift-off speed.
  - b. A C/T model clutch may not be used when the drive speed is higher than the maximum C/T drive speed.
  - c. For overrunning speeds other than listed, contact the factory.
8. When higher speeds are required select the LABYRINTH GREASE SEAL option listed in the Specification chart for each clutch model or contact Formsprag Application Engineering Department.

9. Determine the shaft size, bore and key size requirement of the clutch from the catalog. Refer to the **BORE SIZES/ SHAFT TOLERANCES** chart on pages 42 and 43 for the **ACTUAL BORE SIZE** that will be supplied with the clutch. If the actual bore size required is other than that listed, contact the factory.
10. Select the type of **LUBRICANT, oil or grease**, for the clutch model where appropriate. It should be noted that many of the clutch model are available in either oil or grease only. If the Labyrinth grease seal option is selected in step 8 above, the clutch must be **grease** lubricated.
11. Determine the **DIRECTION OF ROTATION** for the model selected where necessary. When viewing the clutch from the end as shown in the catalog, **if the inner race is to rotate freely in the CCW direction and drive in the CW direction it is a Right Hand (RH) rotation. Left Hand (LH) is opposite.** See clutch rotation on page 8.

The torque values listed in this catalog are based upon normal use with 1 million load cycles at full catalog torque and receiving proper care and maintenance. For Models FSO, HPI, FSA and SB the torque ratings are based upon using only one end face to transmit.

**Caution:** Consult factory for reciprocated type prime mover and any inclined or vertically mounted applications.

## Special Designs

While the wide range of sizes and capacities covered by this catalog's line of clutches will cover substantially all industrial needs, it is sometimes necessary to design and build clutches to meet specialized requirements.

Special designs can also take advantage of a self-contained lubrication system or lubricant contained within the customer's machine. In such cases, lubrication could be introduced through the inner race or through clutches assembled without seals to permit a free flow of oil through the clutch. Since other factors may affect selection of clutches in both indexing and holdback cases, consult our Application Engineering Department for assistance.

When placing an order always use the part number in addition to the model number if available.

The **part number** is marked on the clutch and listed in the price sheets. There is a unique part number for each design and bore combination and the format is as follows:

Example is CL42156-123-2

The model number is marked on the clutch and listed in the product catalog.

**Example:**

- 1. FSO 700 model clutch, optional C/T retainer, 2.2485/2.2500" bore, .625 x .32 keyseat, oil lubricated.
- 2. FSR - 16 model clutch, 1.000/1.001" bore, .50 x .25 keyseat, grease lubricated, right hand rotation.
- 3. HPI 900 model clutch, optional Labyrinth grease seals, 4.498/4.500" bore, 1.00 x .50 keyseat, grease lubricated.

**Example:**

\* If keyseat is not specified when ordering, the clutch will be supplied with the available standard keyseat.

## Overrunning Clutches

### Overrunning Speeds

This is the maximum speed differential between the inner and outer races. When one race is stationary and the other overruns, clutch selection may be based on maximum overrunning speeds shown in the catalog.

### Same direction of rotation

If both races rotate in the same direction at different speeds, the overrunning speed is the *difference* in their speeds.

### Opposite direction of rotation

If the races rotate in opposite directions, the overrunning speed is the *sum* of their speeds.

### Drag Torque

In an overrunning clutch the drag or resistance to freely turn is a result of the additive values of seal drag, bearing drag and sprag energizing drag. This clutch drag torque is noted as “resistance after run-in” and is listed for each model on its data page. The drag (resistance after run-in) torque values for new clutches will be higher at first and after 12 to 24 hours of overrunning at standard motor speeds will reduce to catalog-listed values. When a clutch is overrunning, the drag torque is exerted upon the lower speed race and any attached drive components.

## Clutch rotation

Left Hand Rotation Shown

Right Hand Rotation Shown

If the overrunning clutch design is not symmetrical, then the clutch rotation will need to be determined, and this information (RH or LH) must be provided at time of order placement.

To establish rotation of a clutch, look at the clutch from the end specified by the arrow for each clutch series. If the inner race drives the outer race in the clockwise direction it is a right hand rotation.

## Service Factors

### Formsprag and Stieber Overrunning Clutches

Clutches are suitable for many different power transmission applications. Please refer to this table for the proper service factor for your application.

Typical prime movers are listed at the left, types of loads across the top, and your service factor opposite the typical prime movers.

When torsional or linear vibration is present, use an FSO series clutch and increase the service factor at least 50%. For severe vibration, a greater service factor increase is necessary. To conform with couplings manufacturer's recommendations, use a minimum service factor of 1.5 on all Clutch Couplings.

### Overrunning & Backstopping Applications Service Factors

|             |                                                               | Driven Equipment Load Classifications                                                                                                                                                                               |                                                                                                                      |                                                                                                                                                                       |                                                                                                                                            |

\* Recommended for maximum performance and maximum life.

**Note:** In all cases where considerable vibration is present, a higher service factor may be needed (possibly up to 6).

# General Purpose Clutches

## FSO/HPI

### Overrunning, Indexing, Backstopping Ball Bearing Supported, Sprag Clutches

All models contain **PCE** sprags with Formchrome® and Formsprag “Free-action” retainers except models FSO 550 & FSO 650. Standard clutches and all C/T clutches are oil lubricated. Grease lubrication is available for applications where maintenance is inadequate, or where higher inner race overrunning speeds are required. These clutches mount on a through-shaft, with the inner race driven by a key. The ground O.D. of the outer race is designed as a pilot or mounting surface for attaching parts and is concentric with the bore. Tapped holes are provided in each end of the outer race for securing these parts to the clutches. Refer to Bore Sizes/Shaft Tolerances chart for mounting data, page 42.

For vertical mounting, contact Application Engineering.

#### Model FSO

*General purpose*, ball-bearing clutches suitable for overrunning, backstopping and light to medium-duty indexing applications. They are oil lubricated and equipped with lip type seals. Grease is available. Increased speeds are possible with steel labyrinth seals.

#### C/T Sprag Models (FSO Only)

C/T sprag clutches are ideal for applications with high speed outer race overrunning and low speed driving. Available with oil lubrication only.

#### Model HPI

Especially designed for **medium to heavy-duty** indexing applications, or applications in excess of 150 strokes/min. to provide the maximum in dependable, uniform, long life performance except models FSO 550 & FSO 650. They are oil lubricated and equipped with lip type seals. Grease is available.

#### Oil Lubricated Clutches

FSO-300 through 700 clutches are shipped from the factory with Mobil DTE Heavy Medium oil.

HPI-300 through 700 clutches are shipped from the factory with Mobil DTE Light oil.

#### Grease Lubricated Clutches

FSO-300 through 700 clutches are shipped from the factory packed with Fiske Brothers Lubriplate Low-Temp grease.

HPI-300 through 700 clutches are shipped from the factory with Mobil DTE Light.

OSHA cover kits are available for Models FSO & HPI-400 through 700, see page 39 for details.

For further information, write for *Installation and Maintenance Bulletin No. 2219 for the FSO series and No. 2213 for the HPI series.*

#### Typical Mounting Arrangement

The Model FSO clutches must be axially restrained, see accessories page 36 for set collars, restraint keys and OSHA covers, etc. All fasteners are recommended to be grade 8 bolts.

**Note:** Check key and shaft stress before making final clutch selection since this may determine the maximum allowable drive torque capacity.  
Shaft keys are not provided with the clutches on sizes 300 through 700.

FSO OSHA cover kits are designed for shaft end mounted FSO or HPI clutches and available from Formsprag from size 400 through 1027. These cover kits provide not only the stationary cover enclosure required by OSHA, but provide additional protection for the clutch from abrasive environments as well.

**Note:** OSHA requires that a stationary guard must enclose clutches with rotating projecting parts and operating seven (7) feet or less above the floor.

### Notes:

Angle — oil hole to mounting bolt hole

Model 300, 400, 500 = 45°

600 = 15°

700 = 0° or 30° (offset from center of outer race)

Snap ring is located on the outboard side of the oil seal on Models 400, 600 and 700. On Models 300 and 500, snap ring is inboard of the oil seal.

### Notes:

† Six holes equally spaced at 60° plus two extra holes at 180°. Six hardened mounting screws are adequate for torque loads up to 3000 lb.ft. (4068 Nm). Use eight hardened mounting screws for torque loads above these values.

‡ The "E" dimension is larger for this bore size.

# General Purpose Clutches

## FS/FSO/HPI

### Overrunning, Indexing, Backstopping Ball Bearing Supported, Sprag Clutches

All models contain Formchrome® sprags and Formsprag “Free-action” retainers. These clutches mount on a through-shaft, with the inner race driven by a key. *Standard keys are supplied by Formsprag at no additional charge.* The ground O.D. of the outer race is designed as a pilot or mounting surface for attaching parts and is concentric with the bore. Tapped holes are provided in each end of the outer race for securing these parts to the clutch. Refer to Bore Sizes/Shaft Tolerance chart for mounting data, page 42.

For vertical mounting, contact Application Engineering.

### Model FSO

Allows higher inner race overrunning speeds than FS series. They are also suitable for general overrunning and light-to medium-duty indexing applications.

They are grease lubricated and equipped with grease seals.

### Model HPI

Are especially designed for medium to heavy-duty indexing applications, or applications in excess of 150 strokes/ min. to provide the maximum in dependable, uniform, long life performance. They are oil lubricated and equipped with lip type seals. Grease is available.

### Model FS

Suitable for general overrunning, backstopping and light to medium-duty indexing applications. They are oil lubricated and equipped with lip-type seals.

### C/T Sprag Models (FS Only)

Ideal for applications with high speed outer race overrunning and low speed driving. Available with oil lubrication only.

### Oil Lubricated Clutch

FS-750 through 1027 clutches are shipped from the factory with Mobil DTE Heavy Medium oil.

HPI-750 through 1027 clutches are shipped from the factory with Mobil DTE Light oil.

### Grease Lubricated Clutch

FSO-750 through 1027 clutches are shipped from the factory packed with Fiske Brothers Aero-Lubriplate grease.

HPI-750 through 1027 clutches are shipped from the factory with Mobil DTE Light.

OSHA cover kits are available for Models FS, FSO & HPI-750 through 1027, see page 39 for details.

For further information, write for *Installation and Maintenance* bulletin No. 2219 for FS and FSO series, and No. 2213 bulletin for the HPI series.

### Typical Mounting Arrangement

The Model FSO clutches must be axially restrained, see accessories page 36 for set collars, restraint keys and OSHA covers, etc. All fasteners are recommended to be grade 8 bolts.

#### Notes:

\* FSO-1027 C/T Sprags are not Formchromed.

Check key and shaft stress before making final clutch selection since this may determine the maximum allowable drive torque capacity.

FSO-750 only, shipped with labyrinth seals.

Shaft keys are provided with the clutches on sizes 750 and up.

### Bore sizes and keyseats\*\*\*

inches (mm)

### Notes:

Angle — oil hole to mounting bolt hole

Model 750 = 0° or 30°

900 = 0° or 18°

800 = 0° or 45°

1027 = 15°

# Backstopping Clutches

## FHB

### Backstopping Ball Bearing Supported, Sprag Clutches

**Model FHB is directly interchangeable with the older FALK® Model BIF external high-speed backstop.**

Model FHB is a high speed, centrifugal throw-out (C/T) Sprag type backstop with internal sealed ball bearings. This self-contained design is completely maintenance free. It requires no re-lubrication, no external control, and no adjustment. It engages instantaneously and automatically to prevent any reverse shaft rotation. Model FHB operates at higher overrunning speeds and holds greater torque loads than competing backstops. A larger number of torque transmitting C/T Sprags reduce the hertzian contact stresses during backstopping leading to longer life than is possible with shoe designs.

The FHB backstop is mounted on a through-shaft with its

#### Specifications

| FHB-20 | 1,734<br>(2350)                   | 400                                 | 2,000 | 63<br>(29)                     |
| FHB-60 | 4,130<br>(5600)                   | 400                                 | 1,800 | 158<br>(72)                    |

inner race driven by a key, and its integral outer race torque arm prevented from rotating through a clearance fit interface with a fixed reaction pin. The reaction pin may also be used to provide axial restraint of the backstop on the rotating shaft. Typical uses for the Model FHB backstop include inclined conveyors, bucket elevators, and other applications where a rotating shaft must be absolutely prevented from rotating in a reverse direction, as commonly found in mining, aggregates, material handling, and other industries. The high speed capability of the unit make this backstop ideal for mounting on double extended input shafts of gear reducers. The overrunning speed of the rotating shaft should be greater than 400 RPM to assure C/T Sprag “lift-off”.

**Grease Lubricated Backstops**, the Model FHB is shipped from the factory lubricated for life and the ambient operating temperatures range is from -40°F (-40°C) to 150°F (65°C). **Optional OSHA cover kits** are available for all three sizes. See page 39.

#### Typical Mounting Arrangements

**The Model FHB can be axially restrained by a cotter pin in the reaction pin**

# Backstopping Clutches

## HSB (High Speed Backstops)

### Backstopping Ball Bearing Supported, Sprag Clutches

### Combination sprag clutch and oil reservoir Holdback conveyors and reducers

HSB units are intended for use as backstops on the high speed shaft or intermediate shaft of a reducer, and as holdbacks on the head shaft of conveyors. They use standard clutches with the addition of the oil reservoir. The oil reservoir is an aluminum casting with cooling fins. HSB models have a spacer replacing the seal at the reservoir end to permit free oil flow between clutch and reservoir. The reservoir has a flush oil sight gauge and a combination breather and oil filter. Refer to Bore Sizes/Shaft Tolerance chart for mounting data. Standard keys supplied by Formsprag at no additional charge for models 750 through 1027.

A torque arm is required to prevent the outer race and reservoir from rotating, see page 40.

The FSO-400 through 700 and FS-750 through 1027 clutch assemblies that are used to make up the HSB series clutches are shipped from the factory with Mobil DTE Heavy Medium oil, but must be filled to the proper level before operation.

*For further information, write for Installation and Maintenance Bulletin No. 2214.*

#### Notes:

Check key and shaft stress before making final clutch selection since this may determine the maximum allowable drive torque capacity. Specify direction of rotation when ordering.

HSB-400 to 700 clutch assemblies are FSO clutches plus an HSB oil reservoir kit.

HSB-750 to 1027 clutch assemblies are FS clutches plus an HSB oil reservoir kit.

The reservoir kits are boxed separately.

Always consult the Installation and Maintenance Bulletin 2214 for the special seal modifications required to the FSO clutch when being used with the HSB oil reservoir kit, before attaching the reservoir.

### Typical Mounting Arrangement

The Model HSB clutch with optional FSO Torque Arm, see Accessories, must be axially restrained on the shaft. The above typical drawing shows a customer supplied retaining plate and bolt and a stepped shaft, providing this restraint. All fasteners are recommended to be grade 8 bolts.

\* Angle-breather hole to mounting hole.

\*\* Six holes equally spaced at 60° plus two extra holes at 180°. Six hardened mounting screws are adequate for torque loads up to 3,000 lb.ft. (4068 Nm) for model 700, or 5,100 lb.ft. (6916 Nm) for model 750; use eight hardened mounting screws for torque loads above these values.

# Holdback Clutches

## LLH® (Long Life Holdbacks®)

### Backstopping Technology

Formsprag offers two technologies in backstopping designs, Sprag and Ramp & Roller. The sprag design is comprised of a full complement of accurately formed sprags filling the annular space. The ramp & roller design consists of precision-machined ramps on the inner race and bearing quality cylindrical rollers filling the annular space.

In backstopping or holdback applications, one race is always fixed to a stationary ground member. The function of the holdback clutch is to permit rotation of the mechanism connected to the inner race in one direction only, and to prevent rotation in the reverse direction at any time. Although the clutch normally overruns most of the time, it is referred to as a holdback or backstop in conveyors, gear reducers and similar equipment, because its function is to prevent reverse rotation.

LLH holdback clutches are ready to install. They are equipped with a one-piece, quickly detachable torque arm (simply remove two pins), and grease labyrinth protected oil seals that positively prevent airborne contaminants from reaching internal seals and parts. Oil lubricated, the clutch assembly also includes an oil sight gauge with filter breather, for ease in checking lubricant level. These clutches are designed to be mounted on a through shaft, with the inner race driven by a key. Standard keys are supplied by Formsprag with all holdbacks at no additional charge.

### Sprag Design

(Models LLH-700S through LLH-5000S)

### Ramp and Roller Design

(Models LLH-1250R through LLH-5500R)

### Typical Holdback Specifications

1. Holdbacks installed on elevators and inclined conveyors must have adequate torque capacity to prevent runback, and must comply with the holdback manufacturer's recommended practice in the selection and application of a safe size.
2. The sprags within the holdback must be positioned and individually energized within a suitable retainer. Sprags must act independent of the retainer and independent of the action of any other sprag.
3. The sprags and the bearings within the holdback must be lubricated with lubricant suitable for the applicable extremes of ambient temperatures. The lubrication system must incorporate a transparent area suitable for visual checking of the oil level at approximately the level of the centerline of the shaft, suitable fitting for draining oil from the holdback, means for filling the holdback with oil, and a breather to relieve pressure within the holdback. The breather must be equipped with a renewable filter arranged to prevent entry of foreign matter into the lubrication system. The breather and filter may be incorporated into the oil filling fitting. An oil seal must be installed externally of each bearing.
4. For dusty or abrasive atmospheres the holdbacks must be equipped with a grease-filled labyrinth seal external to each oil seal. A sufficient number of grease fittings must be provided to insure complete filling and purging of the labyrinth.
5. The holdback must be symmetrical to permit field installation for either direction of rotation without disassembly of the sealed holdback assembly.

6. The holdback must be equipped with torque arm securely fastened to the outer race of the clutch. The outer end of the torque arm must be restrained by means that allow the arm to float while preventing rotation of the outer race.
7. The torque and speed capacity specified by the holdback manufacturer must be based upon adequate tests and engineering documentation. Since these units are used as safety devices, an adequate design safety factor must be used. The compressive stress used in the Hertz stress equations will not exceed 450,000 psi.
8. Load carrying elements in the holdbacks will preferably be manufactured from steel forgings, extrusions or bar stock.
9. To assure that proper heat treatment has been given to the holdback parts, relative to hardness, case depth and micro-structure, a certificate of quality attesting to proper metallurgical examination of the above mentioned items by the holdback manufacturer's laboratory will be provided to the purchaser.

# Holdback Clutches

## LLH

### Application Information

Formsprag Long Life Holdbacks are designed to “holdback” reverse torque. They are commonly used on inclined conveyors, bucket elevators, or pumps. Holdbacks have also been used on people moving systems, such as ski lifts and elevators. Specially designed nuclear holdbacks are currently installed on vertical shaft applications in several nuclear power plants with a required 40-year life.

**Torque Arm Mounting Positions** — With standard oil sight gauges, the preferred torque arm mounting position is

approximately horizontal or slightly off of vertical. For installations requiring torque arms oriented in some other position, consult Formsprag.

**Axial Retention Collars** — Formsprag recommends that holdbacks be axially restrained on the shaft. The preferred method of accomplishing this is with set collars (see page 36). Any type of axial restraint applied to the torque arm reaction end will result in uneven bearing loads that will greatly reduce the bearing B-10 life. Restraint keys are also available. See page 37.

### Typical Conveyor Holdback Arrangements

#### Single Head Pulley Drive

Locate the holdback on the opposite end of the head pulley drive shaft from the drive motor, speed reducer and coupling.

There are two rules for selecting holdbacks:

1. The holdback should always be mounted on the drive shaft.
2. The torque capacity of the holdback should be equal to or greater than the rated capacity of the drive motor.

#### Single Drive Pulley Other Than Head Pulley

Locate the holdback on the drive pulley shaft, at the opposite end from the drive motor, speed reducer and coupling.

There are two rules for selecting holdbacks:

1. The holdback should always be mounted on the drive shaft.
2. The torque capacity of the holdback should be equal to or greater than the rated capacity of the drive motor.

**Auxiliary Seals** — All Formsprag holdbacks are furnished with two grease labyrinth-type seals. These seals, when purged with fresh grease periodically in accordance with our maintenance instructions, will protect the clutch against dusty or abrasive environments.

**Operating Temperatures** — For temperatures above 200°F consult Formsprag.

**Standard Supplied Keys** — All holdbacks are furnished with a hardened (25 – 40Rc) key. Customers should check key and

shaft stress before making final clutch selection since this may determine the maximum allowable drive torque capacity. Do not drive or press-fit the key. It should be installed in the shaft keyway with a “push” fit.

**Extended Storage** — If holdbacks are kept out of operation for six months or more, they should be flushed out and relubricated prior to operation. If holdbacks are to be stored over an extended period of time, consult Formsprag for specific preservation and packaging instructions. See page 33 for extended storage.

## Single Pulley With Dual Drive

Contact Formsprag for selection information on other possible holdback mounting arrangements.

## Tandem Drive Pulleys

Contact Formsprag for selection information on other possible holdback mounting arrangements.

# Holdback Clutches

## LLH

### Selection Procedure

#### Conveyors

There are basically two ways to size conveyor backstops or holdbacks, either according to CEMA (Conveyor Equipment Manufacturers Association) standards or based on motor breakdown/stall torque values. Formsprag recommends that the selection be made on whichever value is greater.

#### CEMA Formula:

The CEMA formula allows the design engineer to consider friction as a partial aid in preventing reverse rotation, thus reducing the torque capacity required for the clutch. Selection by this method does require the use of a service factor (S.F.). The basic CEMA formula for design torque is:

$$T_{\text{CEMA}} (\text{lb.ft.}) = \frac{(\text{S.F.}) (\text{Lift HP} - 1/2 \text{ Friction HP}) (5,250)}{(\text{Headshaft RPM})}$$

Formsprag recommends a minimum service factor of 1.5 when sizing with this formula. See worksheet, page 31.

#### Motor Breakdown or Stall Torque Formula:

Motor breakdown or stall torque could be imposed on the backstop if the conveyor is jammed or frozen, or when the conveyor is overloaded. In this condition the motor will produce stall torque which is significantly higher than the motor nameplate rating. This will cause the belt to stretch; and when the motor stalls, the stall torque produced by the motor will be imposed on the backstop. This torque will be increased if there is a load on the belt. Therefore, the maximum loading on a backstop occurs in the rare case of a moving belt being gradually overloaded until the motor reaches stall or breakdown torque. The torque on the backstop will be the motor torque from the stretched belt plus the torque from the load moving in the reverse direction due to the force of gravity.

To select a holdback based on motor breakdown torque, calculate motor torque using the following formula:

$$T_{\text{motor}} (\text{lb.ft.}) = \frac{(\text{S.F.}) (\text{Motor Nameplate HP}) (5,250)}{(\text{Headshaft RPM})}$$

The clutch may be selected on the basis of installed nameplate horsepower without using a service factor (S.F.), provided the motor breakdown torque does not exceed 175 percent of the nameplate rating; a minimum service factor based upon the ratio of motor breakdown torque to 175 percent of nameplate torque is required in order to preclude serious damage to the installation or to the holdback.

#### Torque Limiting Device:

If a torque limiting device is used and is less than 175 percent of the motor nameplate torque, then the holdback selected should have a capacity not less than 1.5 times the CEMA runback torque.

#### Bucket Elevators

When selecting and sizing long life holdbacks application on bucket elevators, friction may or may not be considered because it is usually only a small fraction of the lift HP required. Similarly, motor breakdown HP is usually not considered if traction wheel drives are used because the elevator will usually slip before the breakdown HP is reached. For these reasons, the recommended design torque is based on lift HP alone.

$$T_B (\text{lb.ft.}) = \frac{(\text{S.F.}) (\text{Lift HP}) (5,250)}{(\text{Headshaft RPM})}$$

A minimum service factor (S.F.) of 2.0 is recommended. If additional assistance is needed, consult Formsprag Application Engineering.

### Speed and Idler Factors

#### Conveyors under 500' in length

Based on:

Material Weight (W)

Total Lift (H)

Conveyor Length (L)

F = Speed factor for empty belt

C = Idler factor for loaded belt

Factor used depends on H/L Ratio  
(Sine of Angle of Slope)

| Belt Width | Material Weight (lb.ft.3) |      |         |      |         |      |          |      |          |      |      |      | 200 lbs. $\frac{H}{L}$ (Ratio) |   |      |

### Worksheet—CEMA Formula

Holdback torque calculations are based on lift HP minus one-half friction HP. Equations are condensed and constants are tabulated as shown above.

### Data

Conveyor Length  
Belt Speed  
Short Tons Per Hour  
Total Lift  
Headshaft Pulley Diameter  
Belt Width  
Material Weight  
Speed Factor  
Idler Factor  
Service Factor

L = \_\_\_\_\_ feet  
S = \_\_\_\_\_ FPM  
W = \_\_\_\_\_ TPH  
H = \_\_\_\_\_ feet  
D = \_\_\_\_\_ feet  
= \_\_\_\_\_ inches  
= \_\_\_\_\_ lb./ft.<sup>3</sup>  
F = \_\_\_\_\_  
C = \_\_\_\_\_  
= \_\_\_\_\_  
(1.5 minimum)

### Calculations

Enter the data into these equations and perform the calculations following the sample worksheet.

(1) Power to lift load (P1):

$$P1 = \frac{WH}{990} = \frac{(\quad)(\quad)}{990} = \quad \text{HP}$$

(2) Power to move empty belt and idlers (P2):

$$P2 = \frac{.5LSF}{1,000} = \frac{.5(\quad)(\quad)(\quad)}{1,000} = \quad \text{HP}$$

(3) Power to move loaded belt (P3):

$$P3 = \frac{.5LWC}{990} = \frac{.5(\quad)(\quad)(\quad)}{990} = \quad \text{HP}$$

(4) Total Holdback Power (HBP) = P1 – P2 – P3 = \_\_\_\_\_ HBP

(5) Holdback Torque ( $T_{\text{Cema}}$ ) =  $\frac{(\text{HPB})(\pi D)}{S} \times \text{Service Factor}$

$$T_{\text{Cema}} = \frac{(\quad)(\quad)(\quad)(\quad)}{(\quad)} = \quad \text{lb.ft.}$$

## Torque Arm Installation

The torque arm reaction force is the force which the torque arm stops must resist. Formsprag recommends that the stops be at least 3/4 of the distance (B) away from the center line of the clutch.

The torque arm reaction force is calculated as follows:

Torque Arm Reaction—lbs. (kg) =  $\frac{\text{*Rated Backstopping Torque—lb.ft. (Nm)}}{\text{Distance (.75B) of stop from centerline—ft. (m)}}$

**Note:** Do not restrict torque arm movement in the axial direction.

\*Ratings are shown on page 21 of catalog for applicable holdback.

## Torque Arm Clearance

Torque arm clearance is required on all sides of the torque arm to prevent binding which could cause uneven loading of the holdback bearings.

**Note:** The torque arm must not be rigidly fastened at reaction point.

Models 700 thru 900

Models 1027 thru 5000

### OSHA Cover Kit

End cover kits for shaft end mounted LLH units are available from Formsprag. These cover kits provide not only the stationary cover enclosure required by OSHA, but additional protection for the LLH from abrasive environments as well.

**Note:** OSHA requires that clutches with projecting parts (and operating seven (7) feet or less above the floor) must be enclosed by a stationary guard (see below). Also, shaft couplings with bolts, nuts and set screws must be covered with safety sleeves unless they are counter sunk or do not extend beyond the flange of the coupling (see below).

(k) *Guarding of clutches, cutoff couplings, and clutch pulleys*—(1) Guards. Clutch cutoff couplings, or clutch pulleys having projecting parts, where such clutches are located seven (7) feet or less above the floor or less above the floor or working platform, shall be enclosed by a stationary guard constructed in accordance with this section. A “U” type guard is permissible.

| Size     | End Cover Part No. | Dimension “A” Inches |
|----------|--------------------|----------------------|
| LLH-700  | CL-7891            | 2.00                 |
| LLH-750  | CL-7892            | 2.00                 |
| LLH-800  | CL-7893            | 2.00                 |
| LLH-900  | CL-7894            | 2.00                 |
| LLH-1027 | CL-7895            | 2.50                 |
| LLH-1051 | CL-7896            | 2.50                 |
| LLH-1250 | CL-7897            | 2.50                 |
| LLH-1300 | CL-7898            | 2.50                 |
| LLH-1375 | CL-7899            | 3.00                 |
| LLH-2000 | CL-7900            | 3.00                 |
| LLH-2400 | CL-7901            | Consult Formsprag    |
| LLH-3500 | CL-7902            |                      |
| LLH-5000 | CL-7902            |                      |

(i)(2) *Couplings*. Shaft coupling shall be so constructed as to present no hazard from bolts, nuts, setscrews, or revolving surfaces. Bolts, nuts, and set screws will, however, be permitted where they are covered with safety sleeves or where they are used parallel with the shafting and are countersunk or else do not extend beyond the flange of the coupling.

FEDERAL REGISTER,  
VOL.36, NO. 105—  
SATURDAY, MAY 29, 1971

Sizes 700 through 1027

Sizes 1051 through 5000

### Lubrication

LLH Clutches are normally oil lubricated, see the Installation and Maintenance Bulletin No. 2224 for Models 700 thru 1027 or Bulletin No. 2211 for Models 1051 thru 5000 for the list of approved lubricants.

#### Grease Recommended for Long Life Holdbacks

Grease is recommended for vertical shaft applications, but it is not to be used where ambient temperatures are below +20°F. Below +20°F, consult Formsprag.

#### Storage

Formsprag LLH's are shipped 3/4 full of oil and ready for operation. If the clutch is to be stored for a long period of time (6 months to 2 years), it must be completely filled with oil (Mobil Artic “C”) and stored under a roof at above freezing temperatures. At the customer's request, Formsprag will prepare the clutch for storage in accordance with our Spec SP-2700.

### Oil Lubrication

The oil level should be checked weekly. To add oil, remove breather cover (entire breather on Model LLH-700), and pour oil into holdback.

Use a recommended oil for the permissible ambient temperature range as specified in the Installation and Maintenance Bulletin No. 2224 for Models 700 through 1027 or Bulletin No. 2211 for Models 1051 through 5000. Formsprag holdbacks are shipped three-fourths full of Mobil DTE Heavy Medium oil.

Holdbacks should be flushed every six months. If holdbacks operate under severe dust conditions, or 24 hours a day, flush every three months.

### Auxiliary Seal Lubrication

Auxiliary seals should be lubricated every three months/monthly if clutch operates under extremely dusty conditions. To relubricate auxiliary seals, pump seals full, through all fittings on both sides, until old

grease is purged and clean grease runs out around the entire circumference of seal.

Use a grease selected from the Installation and Maintenance Bulletin No. 2224 for Models 700 through 1027 or Bulletin No. 2211 for Models 1051 through 5000. Auxiliary seals are packed with Mobil Oil SHC 32 grease prior to shipment.

*For additional information, request Lubrication & Maintenance Brochure A-4032 and Installation & Maintenance Bulletin No. 2224 for Models 700 through 1027. For Models 1051 through 5000, request Installation & Maintenance Bulletin No. 2211.*

### Metric (millimeters)

Bore and shaft tolerances listed below will give the recommended fit for each size clutch. If the installation requirements make a press fit necessary, never exceed .025 mm interference fit. For all bore and shaft sizes not listed below use same tolerances and fits as next larger size.

For metric bores the recommended bore tolerances are F7.

| Nominal Bore | Bore Diameter | Shaft Diameter |
|--------------|---------------|----------------|
| 49.20        | 49.24/49.26   | 49.21/49.17    |

## Axial Restraint Set Collars

### Axial Restraint

Formsprag requires that all clutches and holdbacks be axially restrained when mounted. Our recommended bore to shaft fits are loose to facilitate installation and removal, therefore, axial restraint must be provided by set collars, shoulders, restraining keys, retaining snap rings, retainer plates, or some other axial restraint device approved by Formsprag.

Holdback axial restraint is required to prevent the reaction end of the torque arm from imposing biasing loads on the bearings. Holdbacks installed without axial restraint can shift on the shaft, causing bearing loads which can significantly reduce bearing B-10 life.

For customers wishing to have a tolerance gap between the axial restraining device and the holdback inner race, a maximum gap of 1/8" per side is recommended.

| Model | Required Shaft Length |        |
|-------|-----------------------|--------|
|       | in.                   | mm     |
| 700   | 8.67                  | 220.22 |
| 750   | 9.64                  | 244.86 |
| 800   | 9.91                  | 251.49 |
| 900   | 10.28                 | 261.11 |
| 1027  | 11.03                 | 280.16 |
| 1051  | 12.13                 | 308.10 |
| 1250  | 13.25                 | 336.55 |
| 1300  | 13.25                 | 336.55 |

## Axial Restraint Set Collars

## Axial Restraint Keys Introduction

Restraint keys are a cost effective method of providing axial restraint for clutches and holdbacks. The restraint key is longer than the clutch through bore length or clutch width. The single block key will prevent axial movement in only one direction and must be used with some other means to prevent movement in the other direction such as a set collar or a step in the shaft.

The double block key will prevent axial movement of the clutch in either direction. All restraint keys must be secured in the shaft key seat. This can usually be accomplished by cutting the keyseat with an end mill without breaking out at the end of the shaft.

### Single Block

LLH-700 thru LLH-1027

LLH-1051 thru LLH-5000

### Double Block

LLH-700 thru LLH-1027

LLH-1051 thru LLH-5000

3500 to 5000 as required

Note: Restraint keys must be secured in shaft keyseat.

# Accessories

## Stub Shaft Adapters

For Clutch Sizes 400 through 1027 Mount Gears, Pulleys, and Similar Attachments

Stub shaft adapters are available to fit clutches from size 400 through 1027. They are secured to the clutch by fastening to the tapped holes at the end face of the outer race. The stub shaft adapters may be used to mount gears, pulleys or similar attachments when the item to be mounted is too small to mount on the O.D. of the clutch, and to mount couplings when the customer desires to use a coupling other than the Formsprag-Formflex clutch coupling assembly.

Hardened bolts are supplied by Formsprag at no additional charge with purchased adapters.

### Selection

| Size | Adapter No. | Kit No.   |
|------|-------------|-----------|
| 400  | A-4         | AC30156   |
| 500  | A-5         | AC30157   |
| 600  | A-6         | AC30158   |
| 700  | A-7         | AC30159-4 |
| 750  | A-7.5       | AC30161-5 |
| 800  | A-8         | AC30160-6 |
| 900  | A-9         | AC30162-4 |
| 1027 | A-10        | AC30163-A |

Consult Formsprag for other stub shaft adapter sizes.

## FSO, FHB OSHA Cover Kits

FSO OSHA cover kits are designed for shaft end mounted FSO or FHB clutches and available from Formsprag from size 400 through 1027. These cover kits provide not only the stationary cover enclosure required by OSHA, but provide additional protection for the clutch from abrasive environments as well.

The OSHA cover kit includes the cover and required fasteners.

**Note:** OSHA requires that a stationary guard must enclose clutches with rotating projecting parts and operating seven (7) feet or less above the floor.

\* These covers can be used on other Formsprag clutches so there may be additional mounting holes, not required for the FHB Backstops.

## FSO Torque Arm

FSO Torque Arms are used to help facilitate the installation of the clutch when used as a backstop. The FSO Torque Arms are available to fit clutches from size 300 through 1027. These arms are designed to work with Clutch Models FSO, HPI, and HSB.

The torque arm must be secured to the clutch and must not be rigidly fastened at the reaction point. Rotation of the clutch must be restricted at the reaction point by either a pin or angle iron. Torque arm reaction point clearance is required on all sides of the arm to prevent binding, which could cause uneven loading of the clutch bearing, resulting in reduced clutch life.

Stieber has two manufacturing facilities: one in Munich and a second in Heidelberg. These plants have produced identical clutches marketed under different part numbers as listed in the chart below. The models listed in bold are in current production and supersede the other model.

\* Also available for end face GR lubrication

† FSO Series with labyrinth seal option

## Bore Sizes and Shaft Tolerances

### English (inches)

Bore and shaft tolerances listed below will give the recommended fit for each size clutch. If a press fit is necessary, never exceed .001" (.025mm) interference fit. For all bore and shaft sizes not listed below use same tolerances and fits as next larger size.

### Sleeve Bearing Clutches

| Series | Nominal Bore | Bore Diameter | Shaft Diameter |

Note: On Models 750 thru 5000, Formsprag may elect to supply a stepped key in the event of keyseat distortion during heat treat of inner race.

- <sup>1</sup> Model 750 only
- <sup>2</sup> Model 900 only
- <sup>3</sup> Model 1027 only
- <sup>4</sup> Model 1051 only
- <sup>5</sup> FSO 600/2.00 tolerance 2.000/2.001
- <sup>6</sup> Model 800 only

## Bore Sizes and Shaft Tolerances

## Metric (millimeters)

Bore and shaft tolerances listed below will give the recommended fit for each size clutch. If a press fit is necessary, never exceed .001" (.025mm) interference fit. For all bore and shaft sizes not listed below use same tolerances and fits as next larger size.

For Metric bores the recommended bore tolerances are H7.

## Mounting Requirements

### Press fit assemblies

Shaft and bore tolerances are specified on the pages for each type where press fitting is appropriate.

As with standard bearings, suitable tooling must be used for press fitting such that no axial load is transmitted through the inner part of the clutch during assembly.

### Metric Key assemblies

For all overrunning clutch inner races connected to shaft by a key, our standard bore tolerance is H7, with keyway to JS10.

We recommend a shaft tolerance of h6 or j6. For maximum indexing accuracy, adjusted keys should be machined to give no clearance.

(Metric keyseat dimensions listed on page 45.)

## Mounting Examples

Listed below are a number of clutch models that are used in backstopping applications. In each case the clutch must be axially restrained on the shaft and the torque arm must be restrained from rotating, but free to float in the axial and radial planes to avoid pre-loading the internal bearings of the clutch.

## Bearing Loads

Formsprag ball bearing clutches are able to carry both radial and thrust loads. Often it is necessary to check the radial loading of the bearings for an application where the clutch is subjected to radial loads imposed by drive chains, gears, sprockets or V-belts. The radial loads imposed by high tension, multi- V-belts are particularly high.

The load that can be applied to a ball bearing clutch is dependent upon the bearings used in the clutch and the recommended bearing load rating as specified by the bearing manufacturer. Table 1 gives the Maximum Permissible Load (lbs.) for radial and thrust conditions for Formsprag ball bearing clutches sizes 300 through 1027. These loads are based upon a calculated L-10 bearing life of 10,000 hours (50,000 hrs. avg. bearing life). Higher loads are possible at lower speeds.

Condition #1 (A) is the Maximum Permissible Load (lbs.) for radial loads centered between the bearings.

Condition #2 (B) is the Maximum Permissible Load (lbs.) radially applied above the end face of the clutch.

Condition #3 (C) is the Maximum Permissible Load (lbs.) radially applied which can be offset or overhung from the end of the clutch.

**Example:** Determine the Maximum permissible load (C) that can be radially applied to a stub shaft adapter 10 inches from the end of a FSO-700 clutch.

Using the formula:

$$\text{Load (C)} = \frac{(A) (L)}{2 (d + D + L)}$$

$$\text{Load (C)} = \frac{2520 \times 3.060}{2 (10 + .925 + 3.060)}$$

$$\text{Load (C)} = 276 \text{ lbs.}$$

L-10 bearing lives for loads and speeds other than those listed in Table 1 for each clutch may be calculated by using the following formula:

$$(L-10)_0 = \left( \frac{A}{X_0} \right)^3 \times \left( \frac{N}{N_0} \right) \times 10,000$$

where: (L-10) is the new L-10 life in hrs.

$X_0$  is new load in lbs.

A is load from Table 1 in lbs.  
(note: B and C can be used in place of A for Conditions #2 and #3 as required)

N is overrunning (O/R) speed from Table 1.

$N_0$  is new O/R speed.

### Condition #1

Condition #1 has force or Load (A) in center of clutch between the two ball bearings. (See Table 1.)

### Condition #2

Condition #2 has force or Load (B) exerted on clutch bearings at end of clutch. Distance "D" is the distance from the centerline of the ball bearing nearest the load to end of clutch.

(See Table 1)

### Condition #3

Condition #3 has force or load applied "d" distance from face of the clutch. (To be determined by individual application.) To calculate the Maximum Permissible Load (C) a distance "d" from the clutch face, use the following equation:

$$\text{Load (C)} = \frac{(A)(L)}{2 (d + D + L)}$$

(Refer to Table 1 for values of A, D and L)

Table 1

| Clutch No. | Maximum Permissible Load |                  | D in. | L in. | Thrust Cap. @ Max. O/R Speed lb.* | Max O/R Speed RPM |
|------------|--------------------------|------------------|-------|-------|-----------------------------------|-------------------|
|            | Cond. #1 (A) lb.         | Cond. #2 (B) lb. |       |       |                                   |                   |
| FSO-300    | 413                      | 150              | .516  | 1.381 | 413                               | 3,600             |
| FSO-400    | 480                      | 160              | .675  | 1.376 | 467                               | 3,600             |
| FSO-500    | 816                      | 297              | .745  | 1.990 | 820                               | 3,000             |
| FSO-600    | 879                      | 304              | .836  | 1.950 | 1,039                             | 2,400             |
| FSO-700    | 2,559                    | 982              | .925  | 3.060 | 2,810                             | 2,000             |
| FSO-750    | 1,656                    | 612              | 1.247 | 3.550 | 2,158                             | 1,800             |
| FSO-800    | 2,412                    | 891              | 1.251 | 3.542 | 3,237                             | 1,500             |
| FSO-900    | 3,183                    | 1,191            | 1.257 | 3.740 | 4,046                             | 1,350             |
| FSO-1027   | 1,013                    | 353              | 1.446 | 3.355 | 2,750                             | 1,100             |

\* Always contact Formsprag Engineering for approval when applying axial loads to the clutch.

**Example:** Determine the maximum permissible load that can be radially applied between the bearings of a FSO-750 with an overrunning speed of 600 RPM that will result in a L-10 bearing life of 10,000 hours.

Since the load is applied between the bearings the value (A) for Condition #1 is used for this calculation. Also, because the bearing life is 10,000 hours, the new L-10 remains at 10,000 hrs.

Using the bearing life formula:

$$(L-10)_0 = \left(\frac{A}{X_0}\right)^3 \times \left(\frac{N}{N_0}\right) \times 10,000$$

Substituting values into the equation:

$$10,000 = \left(\frac{2,040}{X_0}\right)^3 \times \left(\frac{1,800}{600}\right) \times 10,000$$

$$X_0^3 = 2,040^3 \times \frac{1,800}{600} \times \frac{10,000}{10,000}$$

$$X_0 = \sqrt[3]{2,040^3 \times 3 \times 1}$$

$$X_0 = 2,942 \text{ lbs}$$

**Answer:** The new maximum permissible radial load that can be applied is 2,942 lbs.

The clutch thrust capacity at Max. O/R speed given in Table 1 is the **Maximum permissible load** applied in an axial direction to the end of the clutch. The clutch thrust capacity listed in Table 1 is without any radial load applied to the clutch.

For applications that have both thrust and radial loads consult Formsprag engineering.

## Lubrication

Proper lubrication and lubricant maintenance are the most important single maintenance factors for long, effective, trouble-free clutch operation.

Many models are shipped from the factory prelubricated and ready to install. Some models require lubrication to be added prior to being put into service, and other designs rely on lubrication integral to the application, see the model data pages for details.

Formsprag has evaluated and approved a wide selection of oil and grease lubricants necessary to meet a wide range of customer application needs. If no lubricant is specified on the order, the clutch will be supplied with the standard lubricant that is listed on the model data page. Not all lubricants are

compatible, so before switching check with Formsprag Engineering. Grease lubrication is recommended for applications where: (1) conditions do not permit the type of maintenance required for oil lubricated clutches, (2) the clutch is exposed to severe dusty conditions, (3) the clutch is mounted on a vertical shaft.

The selection of the proper lubricant for each application should include the ambient temperature range; see the table below for a listing of approved lubricants. Contact Formsprag Engineering if you have any questions about lubrication.

## Recommended Lubricants

| Overrunning and Backstopping Applications                                                                                                                                                                                           |                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                             |                                                                                                                                     |

\* This lubricant is suitable for a low temperature and low speed application.

\*\* Any automatic transmission fluid (ATF) without friction reducing agents or high friction modifier, synthetic preferred.

**CAUTION:** Do not use EP additives type lubricants (extreme pressure characteristics) or those containing slippery additives, such as molybdenum disulfide graphite compounds.

# Overrunning Clutches Application Data Form

For Application Assistance call 1-800-927-3262 or Fax (586) 758-5204

Date \_\_\_\_\_

Company name \_\_\_\_\_

Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip \_\_\_\_\_

Name of contact \_\_\_\_\_ Title \_\_\_\_\_

Phone \_\_\_\_\_ Fax \_\_\_\_\_

## Type of equipment

\_\_\_\_\_

## Type of application

☐ Overrunning ☐ Indexing  
☐ Backstop ☐ Clutch Coupling

## Maximum torque at clutch

\_\_\_\_\_ pound-feet, or  
\_\_\_\_\_ HP at \_\_\_\_\_ RPM

## Power Source

☐ Electric motor ☐ Diesel engine  
☐ Turbine ☐ Air cylinder  
☐ Gasoline engine

## Load Application

☐ Smooth ☐ Moderate ☐ Shock

## Lubrication

☐ Runs in oil ☐ Not accessible  
☐ Accessible for lubricating

## Type or specification of lubricant

\_\_\_\_\_

## For overrunning or backstop applications

Inner race speed during overrunning \_\_\_\_\_ RPM max.

Outer race speed during overrunning \_\_\_\_\_ RPM max.

If both members are rotating during overrunning, are they rotating in the

☐ Same direction ☐ Opposite directions

## Time cycle of Formsprag clutch

Drive \_\_\_\_\_ minutes Rest \_\_\_\_\_ minutes

Over-run \_\_\_\_\_ minutes

## For indexing applications

Indexes per minute \_\_\_\_\_ max.

Degrees per index \_\_\_\_\_ max.

## Clutch operating time

\_\_\_\_\_ hours per day

## Shaft diameter (give limits)

\_\_\_\_\_

## Size of keyseat in shaft

\_\_\_\_\_

## Environment

Temperature range \_\_\_\_\_ °F to \_\_\_\_\_ °F

Exposed location? \_\_\_\_\_

Radiation? \_\_\_\_\_

## For non-symmetrical clutches and clutch-couplings

a. Identify the end from which the clutch is viewed

\_\_\_\_\_

b. The (inner, outer) member (drives, over-runs) in the (clockwise, counter-clockwise) direction

## Anticipated quantity required

a. For this application

\_\_\_\_\_

b. Annually

\_\_\_\_\_

## Supply a sketch of your installation.

**Note:** A clutch is not a coupling. When necessary to couple two shafts, a coupling must be used with the clutch. Ambient temperature should not exceed approximately 150°F. It is requested that prints of installation be supplied if available.

## Warranty

Formsprag LLC warrants that it will repair or replace (whichever in its sole discretion it deems advisable) any product it manufactured and sold which proves to be defective in material or workmanship within a period of one (1) year from date of original purchase for consumer, commercial or industrial use. This warranty extends only to the original purchaser and is not transferable or assignable without Formsprag LLC's prior consent.

This warranty covers normal use and does not cover damage or defect which results from alterations, accident, neglect, disassembly, or improper installation, operation, or maintenance.

Formsprag LLC's obligation under this warranty is limited to the repair or replacement of the defective product. In no event shall Formsprag LLC be liable for consequential, indirect or incidental damages of any kind incurred by reason of manufacture, sale or use of any defective product. Formsprag LLC neither assumes nor authorizes any other person to give any other warranty or to assume any other obligation or liability on its behalf.

## Performance Assurance

Rated torque and speeds of Formsprag Clutch products are provided in current catalogs to assist the buyer in selecting the proper Formsprag Clutch product. In addition, application assistance is offered by Formsprag Clutch for guidance to the buyer in selection of a catalog product and application of custom designed products. Since the actual performance characteristics of all Formsprag Clutch products in the buyer's application is the responsibility of the buyer, performance assurance is usually accomplished through manufacture of a prototype by Formsprag Clutch, and a test or qualification program on the part of the buyer.

## Rotating Equipment

Rotating equipment is potentially dangerous and should be properly guarded. The user should check for all applicable safety codes (in local area) and provide a suitable guard. Formsprag clutches and backstops have surfaces which wear with use over time and as a result will need to be replaced. The decision for time of replacement must be made by the operator of the equipment based upon the specific application and performance of the clutch or backstop.

## Catalog Changes

The contents of this catalog are subject to change without notice or obligation.

## Remanufactured Clutches... Look like New, Warranted like New.

Formsprag Rebuild Service Department can refurbish your overrunning clutches. We take your worn, scaled, seized, scored, or rough running clutches and make them like new...for substantially less than the replacement cost.

As a major manufacturer of overrunning clutches, we have the people, facilities, and experience to rebuild and replace all components as needed. The same standards of excellence that exist in the manufacture of original equipment clutches are closely adhered to in the overhaul procedure of every rebuilt clutch.

## The difference is not just cosmetic.

The Rebuild Service Department will perform the following procedures to restore your overrunning clutches to original specifications with a new warranty:

All internal components—sprags, energized springs, retainer, bearings, seal and hardware are refurbished or replaced to new performance standards. The inner and outer races are ground to specifications noted below so that no wear patterns remain.

- Sprag Surface is hardened to 58-62 Rc
- Sprag Surface finish is 15-25 microinches
- Sprag Surface taper limit is 0.0002 inch per inch

### Consider these advantages:

Price – A guaranteed savings of 30% (compared to list price for a new unit).

Speed – Clutches are received, inspected and rebuilt in the shortest possible time frame.

Warranty – The Model LLH has a 3 year warranty, all other models are 1 year on labor and materials, same as new clutches.

Emergency Breakdown Program – All products that are air freighted into the Formsprag Clutch plant are processed immediately and, in most cases, are able to be rebuilt within a 24-hour period. However, for applications that can't afford 'downtime', a spare clutch is recommended.

We're also interested in helping you prevent problems and failures. We can recommend a preventive maintenance schedule for all your clutches.

Formsprag's Quality Management System is certified to ISO 9001: 2008 and AS 9100 Rev. D
